Control of the case and the production of transforming growth factor oligonucleotide inhibiting the production of transforming growth factor (TGF)-beta 1, TGF-beta 2, TGF-beta 3, cell-cell adhesion molecules (CDMS), integrins, selectins, metalloprofeases (MMPB), their tissue inhibitors (TIMPB) and/or interleukins 10. The oligonucleotides are useful for the preparation of a pharmaceutical composition for inhibiting the formation of metastases in cancer treatment. The oligonucleotides are useful for treating cancer, e.g. bile duct carcinoma, bladder carcinoma, brain tumor, breast cancer, bronchogenic carcinoma, carcinoma of the carcinoma, colon carcinoma, colorectal carcinoma, colorectal carcinoma, encounted a carcinoma, colorectal carcinoma, emphysonal carcinoma, endometrial cancer, epithelial carcinoma, esophageal cancer, gall bladder carcinoma, lung carcinoma, medullary carcinoma, non-small cell cancer, gastric cancer, epithelial carcinoma, medullary carcinoma, non-small cell carcinoma, papillary carcinoma, medullary carcinoma, papillary adenocarcinoma, prostate cancer, small coll carcinoma, sebaceous gland carcinoma, skin cancer, soft tissue cancer, squamous carcinoma, terinoma, uterine cancer, soft tissue cancer, squamous carcinoma, tersinoma, uterine cancer, soft tissue cancer, squamous carcinoma, tersinoma, uterine cancer, acustic neuromas, neurofibromas, trachomas, and pyogenic granulomas; pre-malignant tumors, blastoma, Ewing's tumor and/or myeloma, medullablastoma, mesothelioma, neuroblastoma, neurofibroma, timeslens pincaloma, retinoblastoma, mesothelioma, seminoma, trachomas, antisone lingual retareine carcinoma, retinoblastoma, mesothelioma, seminoma, trachomas, antisone pincareine carcinoma, retinoblastoma, mesothelioma, seminoma, trachomas, antisone pincareine carcinoma, medullablatoma, mesothelioma, seminoma, trachomas, antisone pincareine carcinoma, medullablatoma, metallablatoma, mesothelioma, seminoma, trachomas, antisone pincareine carcinoma, metallablatoma, metallablatoma, metallablatoma, mes Gaps New antisense oligonucleotides inhibiting the synthesis of proteins involved in the formation of metastases such as transforming growth factor-beta 1 (TGF-beta 1), TGF-beta 2 and TGF-beta 3, useful for ö Transforming growth factor beta; TGF-beta-3; antisense therapy; antisense oligonucleotide; ss; cancer; cytostatic. ö formation of metastases. The oligonucleotide is an antisense Antisense oligonucleotide targeting human TGF-beta-3 #731. 0.6%; Score 16; DB 1; Length 18; 100.0%; Pred. No. 1.1e+03; 0; Indels Schlingensiepen K, Schlingensiepen R, Jachimczak P, Bischof A, Hafner M, Egger T; antisense oligonucleotide targeting human TGF-beta-3 Sequence 18 BP; 15 A; 0 C; 0 G; 3 T; 0 U; 0 Other; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           셤
                       The invention relates to an antisense oligonuclectide or its active

derivative selected from AEC46374-AEC46395, targeting human interleukin-
C derivative selected from AEC46374-AEC46395, targeting human interleukin-
C 10 (11-10). Also included are a process of manufacturing the antisense
oligonuclectide chain, a pharmaceutical composition comprising
the antisense oligonuclectide chain, a pharmaceutical composition comprising
the antisense oligonuclectide and TGF-beta 2 antagonist for preparing
c composition for treating cancer. The oligonuclectide is an antisense
oligonuclectide inhibiting the synthesis of proteins involved in the
formation of metastases. The oligonuclectide is an antisense
composition for treating the production of transforming growth factor
(TGF)-beta 1, TGF-beta 2, TGF-beta 3, cell-cell adhesion molecules
c (TGMS), integrins, selectins, metalloproceases (MMPs), their tissue
inhibitors (TIMPs) and/or interleukins 10. The oligonuclectides are
c (TGMS), integrins, selectins, metalloproceases (MMPs), their tissue
c (TMMS), integrins, selectins, metalloproceases (MMPs), their tissue
c carcinoma, colon carcinoma, colorectal carcinoma, carcinoma of the
carcinoma, colon carcinoma, colorectal carcinoma, embryonal carcinoma,
carcinoma, lung carcinoma, medullary carcinoma, papillary carcinoma, medullary carcinoma, papillary daedencearcinoma, procease acarcinoma,
papillary carcinoma, papillary adencer, renal cell carcinoma, papillary carcinoma, papillary daedencer, senter, sender, senter, senter, senter, senter, carcinoma,
papillary carcinoma, uterine cancer, renal cell cancer, senal
trestine carcinoma, uterine cancer, senders, acument, medullatoma, medullato
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises a method for preparing a DNA fragment corresponding to a nucleotide sequence of a 5' end of an mRNA. The method is useful for synthesising a nucleotide sequence to be used as a linker or primer and selectively collecting multiple nucleic acid fragments containing information on the nucleotide sequences at the 5' end of multiple mRNA in a sample. The method is also useful for identifying regions in the genome, which are required for gene regulation and gene expression. The present DNA sequence was used in an example of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cytostatic; anticonvulsant; notropic; muscula; anti-HIV;

```
The invention describes a RNA interference (iRNA) agent (1) comprising a sense sequence and an antisense sequence, where the sense sequences have one or more asymmetrical 2'-0 alkyl modifications, the antisense captuences have one or more asymmetrical phosphorothicate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (1); reducing (M1) apoB-100 levels or glucose-6-phosphatase levels in a subject; producing (II); introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (1) and instruction for its use; and a device the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (1) and instruction for its use; and a device the modification decreases nuclease sensitivity while not decreased to useful for reducing apoB-100 levels or glucose-6-phosphatase levels.

Cuseful for reducing apoB-100 levels or glucose-6-phosphatase levels.

The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apos-100, elevated or otherwise unwanted clevels or disorder cholesterol, and/or disregulation of lipid metabolism. The disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholesterolaemia, statin-resistant chypercholesterolaemia, coronary attery disease (CHD), coronary heart disease (CHD) and atherosclerosis. (1) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-crelated diseases as mentioned above, cancer (e.g. breast, colon or treating the diseases as mentioned above, cancer (e.g. breast, colon or submocerabellar ataxia) or viral disease (e.g., AIDS). This sequence represents a hepatitie C virus (HCV) antisense oligonucleotide that cancer, especial disease (e.g., AIDS). This sequence
                                                                                                                                                                                                                                                                         Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

New interference RNA agent comprising sense sequence and antisense sequence having cholesterol moieties, useful for reducing apoB-100 levels glucose-6-phosphatase levels.

Example 4; SEQ ID NO 6180; 324pp; English.

Computes one of more contractory materies, and the contractor of the contractory of the contractory of the contractory of the contractor o artery disease, coronary heart disease and atherosclerosis, preferably statin-resistant hypercholesteroledemia. (I) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorders e.g., type-2 diabetes or glitaxzone-resistant diabetes. (I) has endonuclease or exonuclease resistance. This sequence represents a human hepatitis C virus (HCV) pallindromic sequence that may be useful as a target for antisense inhibition of HCV in human liver cells. The invention describes an interference RNA (iRNA) agent (I) comprising sense sequence and an antisense sequence, where the sense sequence comprises one or more cholesterol moieties, and the antisense sequence

The invention relates to a method (MI) for treating spinal cord injury in a subject. (MI) involves administering to the subject, a short interfering nucleic acid (siNA) molecule (I) that directs cleavage of a Pas RNA through RNA interference (RNAi) under conditions suitable to modulate the expression of Fas in the subject. Also described: (I) an expression vector comprising (I); (2) a kit comprising (I); (3) a human cell comportaing (I); (4) a pharmaceutical composition comprising (I); and fas gene and Fas ligand (Pasl) lower (antisense) siRNA oligonnoleotide, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Treating spinal cord injury in subject, involves administering to subject, short interfering nucleic acid directing cleavage of Fas RNA through RNA interference under conditions suitable to modulate expression
                                                                                                                                                                                                                                                                            spinal cord injury; short interfering RNA; siRNA; RNA interference; gene silencing; RNA cleavage; Fas; vulnerary; ds.
                                                                                                                                                                                                                        Human Fas and FasL genes lower siRNA sequence SEQ ID NO:300.

Fas RNA through RNA interference (RNAi) under conditions suitable to modulate the expression of Fas in the subject. Also described: (1) an expression vector comprising (1); (2) a kit comprising (1); (3) a human cell comprising (1); (4) a pharmaceutical composition comprising (1); and (5) a method of synthesizing (1). The present sequence represents a human Fas gene and Fas ligand (FasL) target and upper (sense) siRNA oligoniclectide, which is used in the exemplification of the present

Claim 33; SEQ ID NO 328; 200pp; English.

```
The invention relates to a chemically synthesized double-stranded short interfering nucleic acid (sinA) molecule directing cleavage of interfering nucleic acid (sinA) molecule directing cleavage of interference (RNA1), where each strand of the molecule is 18-23 nucleotides in length, and one strand of the molecule comprises nucleotide sequence having sufficient complementarity to the ICAM RNA for the sinA molecule to direct cleavage of the ICAM RNA through RNA. The sinA is useful for downregulation or inhibition of expression of ICAM gene and for diagnosing, preventing or treating diseases associated with cellular adhesion such as inflammatory disorders e.g. rheumatoid arthritis, inflammatory bowel disease, atopic dermatitis and asthma, autoimmune cancer and proliferative diseases e.g. ovarian cancer, lung cancer, renal cancer and proliferative diseases e.g. ovarian cancer, lung cancer, renal cancer and proliferative diseases e.g. ovarian cancer, lung cancer, renal cancer and sisease, brain injury, cerebral atrophy and congenital myopathy, respiratory diseases e.g. chronic obstructive pulmonary hypertension and emphysema (many more diseases are given in the specification). The present sequence one strand of an siRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

The invention relates to a chemically synthesized double-stranded short interfering nucleic acid (siNA) molecule directing cleavage of interfering nucleic acid (siNA) molecule directing cleavage of confinements adhesion molecule (ICAM) RNA through RNA interference (RNAi), where each strand of the molecule is 18-23 nucleotides in length, and one strand of the molecule comprises nucleotide sequence having carficient complementarity to the ICAM RNA for the siNA molecule to direct cleavage of the ICAM RNA through RNA. The siNA is useful for downregulation or inhibition of expression of ICAM gene and for adhesion such as inflammatory diseases of the inflammatory bowel disease, atopic dermatitis and asthma, autoimmune adhesion such as inflammatory diseases e.g. rheumatoid arthritis, adhesion such as inflammatory diseases e.g. rheumatoid arthritis, cancer and proliferative diseases e.g. ovarian cancer, lung cancer, renal concer and sisease, brain injury, cerebral atrophy and congenital myopathy, respiratory diseases e.g. chronic obstructive pulmonary disease, brain injury, cerebral atrophy and congenital myopathy, respiratory diseases e.g. chronic obstructive pulmonary concertion human rown in the specification). The present sequence one strand of an siRNA through the present is the man rown.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Calibration of molecular array data by employing calibration probes that
                                                                                                      Novel chemically synthesized double-stranded short interfering nucleic acid molecule directing cleavage of intracellular adhesion molecule RNA through RNA interference, useful for treating diseases e.g. cancer and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         for calibration of molecular array data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

molecular array. The method involves employing calibration probes that generate signals proportional to the total concentrations of labelled rarget molecules to which the molecular array probes are directed over an entire range of sample solutions and molecular arrays incorporating sets of calibration probes. Method is useful for calibrating different types of signals scanned from a molecular array, or calibrating signals scanned from different molecular arrays. The present sequence is poly (A) normalisation probe used in calibration of molecular array data The invention describes a method of predicting, diagnosing or prognosing a cardiovascular disease by detection of a polynuclectide in a biological sample comprises hybridising at least one of the polynuclectide to a nucleic acid material of a biological sample, thus forming a hybridisation complex, and detecting the hybridisation complex. The polynuclectides, polypeptides, antisense molecule, antibody and reagent are useful for preparing compositions for preventing, predicting or diagnosing, or a medicament for treating a cardiovascular disease, e.g. arteriosclerosis, isohaemia, angina pectoris, or myocardial infarction. This sequence represents a primer used to identify genes differentially generate signals proportional to total concentrations of labeled target molecules, and molecular arrays incorporating sets of calibration probes. e.g. detection Cardiovascular disease differential gene expression related primer #98 Cardiovascular disease; arteriosclerosis; ischaemia; angina pectoris; myocardial infarction; cardiant; antiarteriosclerotic; antianginal; gene therapy; differential gene expression; PCR; primer; ss. relates to a method for calibrating data scanned from a Gaps Predicting, diagnosing or prognosing a cardiovascular disease, e. angina, ischemia, myocardial infarction or arteriosclerosis by de of a polynucleotide in a biological sample comprises detecting a hybridization complex. ö Length 20; 0; Indels Seguence 20 BP; 16 A; 2 C; 0 G; 2 T; 0 U; 0 Other; 0.6%; Score 16; DB 1; Le 100.0%; Pred. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of used bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; antisense; lung dysfunction; nasal airway dysfunction; antinflammatory steroid; ubiquinone; antinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung of ysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate conteainers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiathmatic, analgeaic, hypotensive, immunosuppressive and cytostatic activity, is beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administrated composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to
                                                                                   ö

reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, with a disease or condition such as pulmonary vasoconstriction, highertension, emphysema, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Seguence 20 BP; 15 A; 1 C; 0 G; 4 T; 0 U; 0 Other;

New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

Claim 4; SEQ ID NO 3884; 985pp; English.

The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.

New antisense compound targeted to a nucleic acid molecule encoding Nav1.3, useful for useful for treating a disease or condition associated with Nav1.3, e.g. pain, seizure disorder such as childhood seizure disorder, or ataxia.

Claim 4; SEQ ID NO 3800; 417pp; English.

The present invention relates to an antisense compound targeted to a nucleic acid molecule encoding Nav1.3, where the antisense compound specifically hybridizes with and inhibits the expression of Nav1.3. The compound and composition are useful for treating a disease or condition associated with Nav1.3, e.g. pain including but not limited to neuropathic pain, post-herpetic neuralgia, chronic pain, lower back pain, diabetic neuropathy, trigeminal neuropathy, arthritic pain, acute pain, pain from burns, migraine headache, cluster headache, mild-to-moderate headache; seizure disorder such as childhood seizure disorder, including but not limited to neonatal or infantile epilepsy; or ataxia. The present sequence represente a chimeric phosphorothicate oligonacleotide with 2'MOE wings and a deoxy gap. Used during the antisense inhibition of human Nav1.3 expression, the oligonucleotides are designed to target different regions of the human Nav1.3 RNA.

The invention relates to a method of identifying a genetic profile associated with a neurological, psychiatric or psychological condition, phenotype or state including a sub-threshold neurological, psychiatric or psychological condition, phenotype or state in an individual, comprising screening individuals for a polymorphism in a genetic locus comprising companies receptor D2 (DRD2) gene. The invention also relates to a genetic mutation providing a genetic marker for a neurological, psychiatric, or psychological condition, state or phenotype in an individual, where the presence of a 957 polymorphism is indicative of a psychiatric or psychological condition, phenotype or state. The compositions and methods are useful condition, phenotype or state. The compositions and methods are useful condition, phenotype or state. The compositions and methods are useful condition a genetic profile associated with a neurological, psychiatric or psychological condition. The method enables clinicians to make a genetic-based diagnosis of a neurological, psychiatric or psychological condition and can thereby implement treatment or correct preventative or symptom-ameliorating protocols to reduce the adverse consequences of the condition. This sequence represents a human dopamine incention is the scope of the condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

The present invention relates to human acetyl-Coenzyme A-carboxylass-
alpha (ACC-alpha; see ABZ79442), which can be used for in vitro diagnosis
of cancer (or of an increased risk of developing it), by detecting ACC-
alpha gene mutations or polymorphisms, or altered ACC-alpha protein
expression, relative to a control population. The method is particularly
used to diagnose cancer, especially of bresst or overy, or for assessing
the risk of developing such cancers. The present sequence is a PCR
primer, which was used in an example from the invention
                                                                                                                                                                                                                                                                                                                                                                                               In vitro diagnosis of cancer, particularly breast and ovarian cancer, or susceptibility, comprises detecting alterations in the acetyl coenzyme A-carboxylase alpha gene or protein expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; polycomb group protein; EZH2; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Transcription or KANA and DNA encoding numan IL-10 in multine tissue amplified DNA was then detected via in situ hybridisation with a human IL-10 expression vector. The amplified DNA was then detected via in situ hybridisation with a human IL-10 use of a derivatised cationic liposome containing an agent of interest (e.g., an IL-10 expression vector) to deliver the agent to a site that is liposome administration. The derivatised cationic liposome comprises a cationic liposome forming entity (e.g., a lipid), and a head-group and/or ligand which increases macrophage uptake of the cationic liposome. Such liposome can be used for the delivery of a cationic liposome. Such liposomes can be used for the delivery of a cationic liposome. Such liposome macrophage uptake is used coin miprove therapeutic agent, and is especially useful for the amelioration of cationic liposome macrophage uptake is used to improve targetting and thereby make more efficient use of the cationic liposome and agent of interest If cholesterol is used as the cationic liposome cationic liposome-forming entity is linked to the head group via a cationic liposome-forming entity is linked to the head group via a cationic liposome-forming entity is linked to the head group via a cationic liposome-forming entity is linked to the head group via a cationic liposome, and also increases the overall positive charge on the liposome. As polyamines occur naturally in cells, correctly considered by a binding and cationic by the liposome. As polyamines occur naturally in cells,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                       Use of composition comprising combination of derivatized cationic liposomes and active agent in gene therapy, especially for amelioration of established arthritis by IL-10 gene therapy.

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human polycomb group protein EZH2 gene by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense of soligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically motified, can contain deoxyribonucleotides, and can be chemically synthesised. expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in synthesised. The siNAs are used to modulate expression of the EZH2 convict of siNA. The siNAs are used to modulate expression of the EZH2 gene in cells, tissue explants or organisms (e.g., by ex vivo gene the capture of a grafts and transplants for the treatment of a variety of conditions. They may be used for treating cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation canneric enganger.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a human EZH2 targeted
                                                                                                                                                                                 New short interfering nucleic acid, useful e.g. for treatment and diagnosis of prostatic cancer, downregulates expression of the EZH2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human polycomb group protein EZH2 gene by CC RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense coligonucleotide and an antisense oligonucleotide. Specifically, the siNAs coligonucleotide short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Expressed from a vector or enzymatically synthesised. The invention also relates to kite for the in vitro or in synthesised. The invention also relates to kite for the in vitro or in vivo delivery of siNA; conjugates and/or complexes of siNA; and vectors that express siNA. The siNAs are used to modulate expression of the EZH2 conditions. They may be used for treating cancer. The siNAs are also conditions. They may be used for treating cancer. The siNAs are also conditions. They may be used for treating cancer. The siNAs are also and validation, genetic engineering, pharmacogenomics, studying gene condition, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human EZH2 targeted condition.
                                                                                                                                                                                                                                                                             New short interfering nucleic acid, useful e.g. for treatment and diagnosis of prostatic cancer, downregulates expression of the EZH2 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to short interfering nucleic acids (siNh) which downregulate expression of one or more human epidermal growth factor receptor (ESPR) genes (including HER1, HER2 HER3 and HER4) by RNA interference. The siNNs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide short interfering RNA (siRNA), double stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and vector to the in vivo delivery of siNA; conjugates and or complexes of siNA; and vectors that express sinA. The siNAs are used for or a variety of conditions. They may be used for treating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target dentification and validation, genetic engineering, pharmacogennics, studying gene function, and gene mapping (e.g., of single nucleotide and termand of a partey. EEER2 (EGFR2)-targeted double-stranded siNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal growth factor receptor gene.
                                                                                                                                                                                                                                                                                                                                                                                              Jamison S;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Indels

(RIBO-) RIBOZYME PHARM INC.

New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal growth factor receptor gene.

Example 3; SEQ ID NO 247; 171pp; English.

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor receptors (EGFR) genes (including HRR1, HRR2 HRR3 and HRR4) by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and matisense oligonucleotide. Specifically, the siNAs include and antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short cinterfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Cc an contain deoxyribonucleotides, and can be chemically synthesised, can contain deoxyribonucleotides, and can be chemically synthesised. The invention also crace contain deoxyribonucleotides, and can be chemically synthesised. The invention also can contain deoxyribonucleotides, and can be chemically synthesised. The invention also and/or complexes of siNA; and vectors that express siNAs. The siNAs are cused to modulate expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants or creating a wider range of cancers such as breast and ovarian cancer. The treatment of a variety of conditions. They may be used for treating a wider range of cancers such as breast and ovarian cancer. The cidentification and validation, genetic engineering, pharmacogenomics, cidentification and validation, and gene mapping (e.g., of single nucleotide bluman HER2 (EGFR2)-targeted double-stranded siNA, which is identical to the here the HER2 transcript target sequence.

ADO81057; Query Match RESULT 1520 Matches ADO81057, ઠ The invention relates to a novel isolated small interfering RNA (SIRNA)

polynucleotide, comprising at least one nucleotide sequence from any of
the 20 fully defined sequences given in the specification. The invention
further relates to: a pharmaccutical composition comprising a new siRNA

construct, comprising a polynucleotide that is capable of directing
cranscription of an siRNA; a host cell transformed or transfected with

the above recombinant nucleic acid construct; a method for interfering

the above recombinant nucleic acid construct; a method for interfering

with expression of a protein tyrosine phosphatase (PTP) 1B polypeptide, or

the variant; a method for indentifying a component of a PTP1B signal

transduction pathway; a method for indentifying a component of a PTP1B signal

transduction state in a cell; a method for altering a Jak2 protein

phosphorylation state in a cell; and a method for treating a Jak2 protein

construct an orectic, antiinflammatory, neuroprotective, cytostatic,

antidiabetic, anorectic, antiinflammatory, neuroprotective, cytostatic,

immunosuppressive, and antimicrobial. The novel siRNA polynucleotides can

be used in gene therapy to treat disorders. The composition and methods

cransduction, such as diabetes, obesity, hyperglycaemia-induced

transduction, apoptosis, inflammation, neurodespensative disorders, cancer, autoimmune diseases or infection. This polynuclectide sequence represents an siRNA phosphatase of the invention. owdail incertering RNA; siRNA; protein tyrosine phosphatase; PTP; PTP1B; insulin receptor protein phosphorylation; Jak2; antidiabetic; anorectic; antiinflammatory; neuroprotective; cytostatic; immunosuppressive; antimicrobial; gene therapy; ss; siRNA. New small interfering polynucleotide that modulates protein tyrosine phosphatase (PTP)1B polypeptide signal transduction, useful for treating disorders associated with altered PTP1B signal transduction, e.g.

```
The invention describes a method of typing (M1) a gene (1) that has one or more polymorphic microsatellite loci (PML). The method comprises: PCR amplification of at least one DNA region of (1) that includes PML, using as template a DNA sample containing at least one segment of (1); and catermining the length of the resulting amplicon(s). Also described are: canethod of determining (M2) microsatellite markers (MM) for predisposition to a disease, associated with a gene that includes one or concerp. The method is used to identify microsatellite markers, in a disease-related gene, that are associated with a predisposition to diseases and for predisgnosis of such diseases, especially prion diseases of diseases and for predisgnosis of such diseases, especially prion diseases concerp. This predisposition to metabolic diseases, also to type genes that encode milk proteins, mailgnant hyperthermia syndrome in pigs and metabolic diseases; also to type genes that encode milk proteins.

This processes is also to type genes that encode milk proteins.

Described the processes of the processes of the processes of the processes of the processes and for predisposition for the processes of the processes and for predisposition for the processes of the processes and processes are processes. The method is simpler, quicker and particularly less expensive than known methods based on sequencing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The invention describes a RNA interference (iRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequences have cone or more asymmetrical 2'-O alkyl modifications, the antisense sequence asymmetrical phosphorothioate modifications and the antisense sequence targets a human gene sequence. Also described are: a pharmaceutical preparation comprising (I); reducing (M1) apoB-100 contevels or glucose-6-phosphatase levels in a subject; producing (I); catabilising (I), involves selecting a sequence with activity and introducing one or more asymmetrical modification in the sequence, where the modification decreases nuclease sensitivity while not decreasing its activity; a kit comprising (I) and instruction for its use; and a device that can be dispense or administer a composition comprising (I). (I) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. (M1) is useful for reducing apoB-100 levels or glucose-6-phosphatase levels. The subject is suffering from a disorder characterised by elevated or otherwise unwanted expression of apoB-100, elevated or otherwise unwanted levels and or alipid metabolism. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Interference RNA agent useful for treating dyslipidemias, coronary artery disease, diabetes, cancer or neurological disease, comprises sense sequence and antisense sequence which has specific modifications.
                                                                                                                                                                                                                                                                                                  cytostatic; anticonvulsant; nootropic; muscula; anti-HIV; RNA interference; IRNA, antisense technology; lipid metabolism; cholesterol imbalance; dyslidemia hypercholesterolaemia; coronary artery disease; CAD; coronary heart disease; CHD; atherosclerosis; hepatic glucose production; albetees; cancer; breast cancer; glucose-metabolism-related disorder; diabetees; cancer; breast cancer; colon cancer; lung cancer; neurological disease; Hultington disease; spinocerebellar ataxia; viral disease; AIDS; glucose-6-phosphatase; sg.

interference RNA; iRNA; cholesterol moiety; apoB; glucose-6-phosphatase;
lipid metabolism; cholesterol imbalance; dyslipidaemia;
familial combined hyperlipidaemia; acquired hyperlipidaemia;
disorder is chosen from the HDL/LDL cholesterol imbalance, dyslipidaemias, hypercholestorolaemia, statin-resistant hypercholestorolaemia, coronary artery disease (CAD), coronary heart disease (CAD), and atherosclerosis. (I) is administered to subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorder e.g. diabetes or type-2 diabetes. (I) is useful for treating the diseases as mentioned above, cancer (e.g. breast, colon or lung cancer), neurological disease (e.g., Huntington disease or spinocerebellar ataxia) or viral disease (e.g., AIDS). This sequence the represents a human glucose-6 phosphates entisense oligonucleotide that

The invention describes an interference RNA (IRNA) agent (I) comprising a sense sequence and an antisense sequence, where the sense sequence comprises one or more cholesterol moieties, and the antisense sequence comprises one or more cholesterol moieties, and the antisense sequence comprises one or more cholesterol moieties, and the antisense sequence cargets a human gene sequence. The following are disclosed: a pharmaceutical composition comprising (I); and a device for administering (I) into a patient. (I) is useful for reducing apollo levels or glucose of phosphatase levels in a subject. (I) targets a sequence identical to any one of sequences as given in the specification. (I) comprises a cholesterol moiety is coupled to a sense strand. (I) further comprises a second cholesterol moiety. The second cholesterol complety is coupled to a sense strand. (I) has 21 or more nucleotides. The duplex region of (I) is 19 nucleotides in length. The subject is suffering from a disorder having elevated or otherwise unwanted levels of expression of apo-B-100, elevated or otherwise unwanted levels of cholesterol, and/or disregulation of lipid metabolism. The disorder is combined hyperlipidaemia or acquired hyperlipidaemia, coronary company of the service of t
New interference RNA agent comprising sense sequence and antisense sequence having cholesterol moleties, useful for reducing apoB-100 levels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       artery disease, coronary heart disease and atherosclerosis, preferably statin-resistant hypercholesterolaemia. (1) is administered to a subject to inhibit hepatic glucose production or for treating glucose-metabolism-related disorders e.g., type-2 diabetes or glitaxzone-resistant diabetes. (1) has endonuclease or exonuclease resistance. This sequence represents a human glucose-6-phosphatase pallindromic sequence that may be useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ds; primer; short interfering RNA; siRNA;

This invention describes novel chemically synthesized double stranded short interfering nucleic acid (siRNA) molecules which direct cleavage of a X-linked inhibitor of apoptosis protein (XIAP) RNA via RNA interference (RNAi), where each strand of the siRNA molecule is about 18-23 nucleotides in length and one strand of the siRNA molecule comprises nucleotides in length and one strand of the siRNA molecule comprises.

CC nucleotides in length and one strand of the siRNA molecule comprision comprising the siRNA molecule in a carrier or diluent. The sense and antisense strands are connected via a linker molecule. The sense and comprising the sense region are 2'-deoxy purine cucleotides in the sense region are 2'-deoxy purine cucleotides in the sense region are 2'-deoxy purine cucleotides and the pyrimidine nucleotides are 5'-end, a 3'-end, or both of the 5' and 3' ends of the fragment comprising the sense region includes a terminal cap moiety at a 5'-end, a 3'-end, or both of the 5' and 3' ends of the fragment comprising the sense region. The terminal cap moiety at a 5'-end, a 3'-end, or both of the 5' and 3' ends of the fragment comprising the sense region. The purine nucleotides are 2'-deoxy-2'-fluoro pyrimidine nucleotides of the cantisense region comprises a glyceryl modification at a 3'-end of the antisense region. The antisense region comprises a glyceryl modification at a 3'-end of the antisense region. About 19 nucleotides of each fragment of the siRNA molecule are base-paired to the complementary nucleotides of the other CC antisense region optionally includes a phosphotosphate group. The XIAP RNA comprises Genbank Accession No. NM 001167. The chemically synthesized comprises dowble stranded short interfering nucleic acid elsaperium for the remained region optionally includes a phosphate group. The XIAP RNA comparing a comparing
                                                                                                                                                                                                             New chemically synthesized double stranded short interfering nucleic acid that directs cleavage of an X-linked inhibitor of apoptosis protein (XIAP) RNA via RNA interference, useful in preparing a composition for

This invention describes novel chemically synthesized double stranded short interfering nucleic acid (siRNA) molecules which direct cleavage of a X-linked inhibitor of apoptosis protein (XIAP) RNA via RNA interference (RNAi), where each strand of the siRNA molecule is about 18-23 nucleotides in length and one strand of the siRNA molecule comprises nucleotide sequence having sufficient complementarity to the XIAP RNA. The siRNA molecules can be used to make a cytostatic composition comprising the siRNA molecule in a carrier or diluent. The sense and antisense strands are connected via a linker molecule. The pyrimidine nucleotides in the sense region are 2'-deoxy purine nucleotides and the pyrimidine nucleotides are 2'-deoxy-2'-fluoro pyrimidine nucleotides. The fragment comprising the sense region includes a terminal cap moiety at a 5'-end, a 3'-end, or both of the 5' and 3' ends of the fragment comprising the sense region. The terminal cap moiety is an inverted deoxy abasic moiety. The pyrimidine nucleotides of the antisense region comprises a phosphorothioat comprise cutients are 2'-deoxy-2'-fluoro pyrimidine nucleotides are 2'-deoxy-2'-fluoro comprises a phosphorothioat centre antisense region comprises a phosphorothioat end comprises a glyceryl modification at a 3' end of the antisense region comprises a glyceryl modification at a 3' end of the antisense region comprises a glyceryl modification at a 3' end of the changes antisense region comprises of each fragment of the bithat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New chemically synthesized double stranded short interfering nucleic acid that directs cleavage of an X-linked inhibitor of apoptosis protein (XIAP) RNA via RNA interference, useful in preparing a composition for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 molecule are base-paired to the complementary nucleotides of the other fragment of the siRNA. The 5'-end of the fragment comprising the antisense region optionally includes a phosphate group. The XIAP RNA douprises Genbank Accession No. NM 001167. The chemically synthesized double stranded short interfering nucleic acid (siRNA) molecule is useful in preparing a composition for treating cancer. ADX86130-ADX87180

This invention describes novel chemically synthesized double stranded short interfering nucleic acid (siRNA) molecules which direct cleavage of a X-linked inhibitor of apoptosis protein (XIAP) RNA via RNA interference (RNAi), where each strand of the siRNA molecule is about 18-23 nucleotides in length and one strand of the siRNA molecule comprises nucleotide sequence having sufficient complementarity to the XIAP RNA. The siRNA molecules can be used to make a cytostatic composition comprising the siRNA molecule in a carrier or diluent. The sense and antisense strands are connected via a linker molecule. The pyrimidine composition comprising the siRNA molecule in a carrier or diluent. The sense and antisense strands are connected via a linker molecules. The pyrimidine nucleotides in the sense region are 2'-deoxy purine conclectides and the pyrimidine nucleotides are 2'-deoxy purine conclectides and the pyrimidine nucleotides are 2'-deoxy purine conclection of the fragment comprising the sense region. The terminal cap moiety at a 5'-end, a 3'-end, or both of the 5' and 3' ends of the fragment comprising the sense region. The terminal cap moiety at a 5'-end, a 3'-end, or both of the 5' and 3' ends of the fragment comprises a phosphorothicate contineers region are 2'-deoxy-2'-fluoro pyrimidine nucleotides are 2'-deoxy-2'-fluoro pyrimidine nucleotides of the antisense region. The antisense region comprises a glyceryl modification at a 3'-deoxy purine cucleotides present in the antisense region comprises a phosphorothicate contineers region comprises a glyceryl modification at a 3'-deoxy purine antisense region. About 19 nucleotides of each fragment of the siRNA molecule are base-paired to the complementary nucleotides of the other fragment of the siRNA. The 5'-end of the fragment comprising the sendent of the siRNA molecule are base-paired to the complementary nucleotides of the other fragment of the siRNA molecule are done of the complementary nucleotides.

ö
antisense region optionally includes a phosphate group. The XIAP RNA comprises Genbank Accession No. NM 001167. The chemically synthesized double stranded short interfering Tucleic acid (siRNA) molecule is useful in preparing a composition for treating cancer. ADX86130-ADX87180 represent siRNA molecules which are used in RNA interference mediated inhibition of XIAP gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes novel chemically synthesized double stranded a hot interfering nucleic acid (siRNA) molecules which direct cleavage of a X-linked inhibitor of apoptosis protein (XIAP) RNA via RNA interference (RNAi), where each strand of the siRNA molecule is about 18-23 nucleotides in length and one strand of the siRNA molecule comprises nucleotide sequence having sufficient complementarity to the XIAP RNA. The purine nucleotides in the sense region are 2'-deoxy purine nucleotides and the portining nucleotides in the sense region are 2'-deoxy purine nucleotides and the pyrimidine nucleotides are 2'-deoxy-2'-fluoro pyrimidine nucleotides. The fragment comprising the sense region includes a terminal cap moiety at a 5'-end, a 3'-end, or both of the 5' and 3' ends of the fragment comprising the sense region. The terminal cap moiety is an inverted deoxy absaic moiety. The pyrimidine nucleotides of the antisense region are 2'-deoxy-2'-fluoro pyrimidine nucleotides of the concleotides are 2'-O-methyl purine nucleotides. The purine nucleotides are 2'-O-methyl purine nucleotides. The antisense region comprises a phosphorothicate internucleotide present in the antisense region comprises a phosphorothicate concleotides. The antisense region comprises a glyceryl modification at a 3'-end of the antisense region. About 19 nucleotides of each fragment of the siRNA comprises a glyceryl modification to the siRNA comprises genbank Accession No. Nucleotides a phosphate stranded short interfering nucleic acid (siRNA) molecule is useful in preparing a composition for treating cancer. ADX86130-ADX87180 comprises the siRNA molecules which are used in RNA interference mediated inhibition of XIAP gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
 nucleotides in the sense region are 2'-O-methyl pyrimidine nucleotides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ds; primer; short interfering RNA; siRNA;

This invention describes novel chemically synthesized double stranded short interfering nucleic acid (siRNA) molecules which direct cleavage of a X-linked inhibitor of apoptoais protein (XIAP) RNA via RNA interference (RNAi), where aech strand of the siRNA molecule is about 18-23 nucleotides in length and one strand of the siRNA molecule comprises nucleotide sequence having sufficient complementarity to the XIAP RNA. The siRNA molecules can be used to make a cytostatic composition comprising the siRNA molecule in a carrier or diluent. The sense and antisense strands are connected via a linker molecule. The pyrimidine nucleotides in the sense region are 2'-deoxy purine concleotides in the sense region are 2'-deoxy purine concleotides and the pyrimidine nucleotides are 2'-deoxy purine concleotides and the pyrimidine nucleotides are 2'-deoxy purine comprising the sense region includes at terminal cap moiety at a 5'-end, a 3'-end, or both of the 5' and 3' ends of the fragment comprising the sense region includes can tisense region are 2'-deoxy-2'-fluoro pyrimidine nucleotides are 2'-deoxy purine concleotides are 2'-deoxy-2'-fluoro pyrimidine nucleotides are 2'-deoxy-2'-fluoro contrises a phosphorothioat The arrisense region comprises a phosphorothioat The contriber antisense region comprises a phosphorothioat The arrise antisense region comprises a glyceryl modification at a 3' end of the contriber antisense region comprises a glyceryl modification at a 3' end of the contriber antisense region of each fragment of the strand of strand 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          antisense region optionally includes a phosphate group. The XIAP RNA comprises Genbank Accession No. NM 001167. The chemically synthesized combine stranded short interfering nucleic acid (siRNA) molecule is useful in preparing a composition for treating cancer. ADX86130-ADX87180 represent siRNA molecules which are used in RNA interference mediated
New chemically synthesized double stranded short interfering nucleic acid that directs cleavage of an X-linked inhibitor of apoptosis protein (XIAP) RNA via RNA interference, useful in preparing a composition for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ds; primer; short interfering RNA; siRNA;

This invention describes novel chemically synthesized double stranded short interfering nucleic acid (siRNA) molecules which direct cleavage of short interfering nucleic acid (siRNA) molecules which direct cleavage of a X-linked inhibitor of apoptosis protein (XIAP) RNA via RNA interference (RNAi), where each strand of the siRNA molecule is about 18-23 nucleotides in length and one strand of the siRNA molecule comprises on be used to make a cytostatic composition comprising the siRNA molecule in a carrier or diluent. The sense and antisense strands are connected via a linker molecule. The pyrimidine comprising the sense region are 2'-deoxy purine nucleotides in the sense region are 2'-deoxy purine nucleotides and the pyrimidine nucleotides are 2'-deoxy purine nucleotides. The fragment comprising the sense region includes or the fragment comprising the sense region includes care the fragment comprising the sense region includes can inverted deoxy abasic moiety. The pyrimidine nucleotides of the continent are 2'-deoxy-2'-fluoro pyrimidine nucleotides are 2'-deoxy-2'-fluoro comprises a phosphorothioar. The antisense region comprises a glyceryl modification at a 3' end of the antisense region are 2'-deoxy-purine nucleotides are 2'-deoxy-pur
                                                                                                                                                                                                                                                                                                                                                                                                          New chemically synthesized double stranded short interfering nucleic acid that directs cleavage of an X-linked inhibitor of apoptosis protein (XIAP) RNA via RNA interference, useful in preparing a composition for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 molecule are base-paired to the complementary nucleotides of the other fragment of the siRNA. The 5'-end of the fragment comprising the antisense region optionally includes a phosphate group. The XIAP RNA comprises Genbank Accession No. NM 001167. The chemically synthesized double stranded short interfering nucleic acid (siRNA) molecule is useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 in preparing a composition for treating cancer. Novel chemically synthesized double stranded short interfering nucleic acid molecule useful for cleaving interleukin 4 receptor RNA through RNA interference.

Claim 33; SEQ ID NO 389; 128pp; English.

acids (siNAs) which downregulate expression of receptors for interleukingers (e.g., IL-4 receptor (IL-4R), IL-13 receptor (IL-13R) and IL-2 receptor gamma (IL-2RG)) by RNA interference. The invention also relates to similar siNAs which interfere with the expression of the ligands for these receptors, namely IL-4 and IL-13. The siNAs of the invention may or may not comprise ribonucleotides, can contain deoxyribonucleotides, can be chemically modified and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from invention relates to chemically synthesized short interfering nucleic sense oligonucleotide and an antisense oligonucleotide. Specifically,

the siNAs include short interfering RNA (siRNA), double-stranded RNA, miCro-RNA (miRNA) and short hairpin RNA (shRNA). The invention also cellates to pharmaceutical compositions comprising an siNA targeted to human IL-4R (Refseq accession number NM 000418). IL-13R, IL-2RG, IL-4 or IL-13, especially the siRNAs shown in AEB04245-AEB06055. The invention further discloses expression ovectors and host cells comprising an siNA of the invention. The siNAs exhibit increased resistance to nuclease degradation compared to the prior art. The siNAs of the invention can be used to modulate expression of their target genes in cells, tissue caplants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of interleukin-related conditions. They may be used in the treatment of cancers and other conditions. They may be used in the treatment of cancers and other conditions, viral infection, inflammatory conditions.

Caucoimmune diseases, respiratory and pulmonary diseases (c.g., asthma, chronic obstructive pulmonary diseases, cand diseases, neurological diseases, neural diseases, neurological diseases, candocrine diseases, neurological diseases, candocrine diseases, prion diseases and cremoning, disenderial diseases, mento diseases, neurological diseases, candocrine diseases, prion diseases and content of diseases, and conditions. The siNAs may also be used in drug screening, diseases, therapeutic target identification, and gene capentic engineering, pharmacogenomics, studying gene function, and gene capenates the sense strand of a human IL-4R-targeted double-stranded continue of a human IL-4R-targeted double-stranded
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  siRNA, which is identical to the human IL-4R transcript target sequence

The invention relates to chemically synthesized short interfering nucleic acids (siNAs) which downregulate expression of receptors for interleukin-

decids (siNAs) which downregulate expression of receptors for interleukin-

decids (lil-ARG) by RNA interference. The invention also relates to similar siNAs which interfere with the expression of the ligands for the heavertion may or the manely IL-ARG) by RNA interfered with the expression of the ligands for the chemically modified and may be double or single stranded. They further comprise sense manely IL-4 and IL-13. The siNAs which minkly and short hairpin RNA (shRNA), double-stranded from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs minkNa) and short hairpin RNA (shRNA). The invention also calters to pharmaceutical compositions comprising an siNA targeted to human IL-4R (RefSeq accession number NM 000418). IL-13R, IL-2RG, IL-4 or IL-13, especially the siNAs shown in AEB04245-AEB06055. The invention of the siNAs exhibit increased resistance to nuclease captants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of interleukin-related conditions. They may be used in the treatment of cancers and other captangen size and conditions. They may be used in the treatment of cancers and other conditions. They may be used in the treatment of cancers and other captangen diseases, respiratory and diseases, prion diseases and creaming diseases, mitochondrial diseases, rend diseases, prion diseases and creaming diseases, mitochondrial diseases, rend diseases, prion diseases and carefully diseases, mitochondrial diseases, rend diseases, prion diseases and carefully diseases, mitochondrial diseases, rend diseases, prion diseases and carefully diseases, mitochondrial diseases, rend diseases, prion diseases and carefully diseases, mitochondrial diseases, rend diseases, prion diseases, prion diseases, production-related conditions. The sinAs may also be used in durance and presents expredu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Seguence 19 BP; 1 A; 4 C; 8 G; 0 T; 6 U; 0 Other;

Examination of the problem of the properties of the properties of the invention relates to chemically synthesized short interferring nucleic acids (sinNa) which downreallate expression of receptors for interleuking acids (sinNa) which downreallate expression of receptors for interleuking (1.9.7). In receptor (IL-187) by RNA interference. The invention also relates to similar siNNa which interfere with the expression of the ligands for these receptors, namely IL-13 and IL-2. The siNNa of the invention may or may not comprise informed may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, miscontained short interfering RNA (siRNA). double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The invention also relates to pharmaceutical compositions comprising an siNA targeted to human IL-13R (e.g., IL-13R alpha I (IL13RAI), see RefSeq accession number (and pharmaceutical compositions comprising an siNA stayled to the invention can be used to modulate expression of their increased resistance to nuclease degradation compered to the prior art. The siNAs of the invention can be used to modulate expression of their transplants for the transplants for the treatment of a variety of interleukin-related conditions. They may be used in the city of succession of their canders and other proliferative conditions, viral infection, inflammatory conditions, autochmune diseases, respiratory and pulmonary diseases in cells, and transplants for the treatment of a variety of interleukin-related conditions. They may be used in daya gene therapy) and pulmonary diseases, prior diseases, prior diseases, miccolondial diseases, read and expression and validation, genetic employing the signal and expected double-stranded sinna and reproduction-relat

New chemically synthesized double stranded siNA molecule that directs cleavage of an interleukin-13 receptor (IL-13R) RNA via RNA interference, useful in preparing a composition for treating e.g., inflammatory disorders.

Claim 33; SEQ ID NO 389; 127pp; English.

The invention relates to chemically synthesized short interfering nucleic caids (siNAs) which doursegulate expression of receptors for interleukin-caids (siNAs) which doursegulate expression of receptors for interleukin-lessing and in-3 receptor (IL-4R) and IL-2 receptor gamma (IL-2RG)) by RNA interference. The invention also relates to similar siNAs which interfere with the expression of the ligands for these receptors, namely IL-13 and IL-4. The siNAs of the invention may or these receptors, namely IL-13 and IL-4. The siNAs of the invention may or comprise ribonucleotides, can contain deoxyribonucleotides, can comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, can ense oligonucleotide short hairpin RNA (siRANA), double-stranded RNA, cancer kopharmaceutical compositions comprising an siNA (shanA). The invention also calls comprising an siNA of the invention rule siNAs shown in concased resistance to nuclease degradation compared to the prior art. The siNAs of the invention can be used to modulate expression of their carget genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a cancers and other proliferative conditions, viral infection,

ö
diseases (e.g., asthma, chronic obstructive pulmonary disease (COPD), allergies), cardiovascular diseases, neurological diseases (COPD), diseases, cardiovascular diseases, neurological diseases, renal diseases, ocular diseases, liver diseases, mitochondrial diseases, endocrine diseases, prion diseases and reproduction-related conditions. The slMAs may also be used in drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the sense strand of a human IL-4R-targeted double-stranded siRNA, which is identical to the human IL-4R transcript target sequence. Note: The sequence data for this patent is also available in electronic format directly from the US patent of the contract of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   NOGO receptor; RNA interference; gene silencing; neuroprotective; gene therapy; neurological disease; short interfering RNA; siRNA; ss.

                                                                                                                                                                                                                                                                                                  The invention relates to a novel chemically synthesized double stranded short interfering nucleic acid (siNA) molecule which directs cleavage of a NOGO receptor RNA via RNA interference (RNAI). Each strand of the siNA molecule is 18-23 nucleotides in length. One strand of the siNA molecule comprises a nucleotide sequence having sufficient complementarity to the NOGO receptor RNA. The siNA molecules include short interfering RNA (siRNA), double-stranded RNA (dsRNA), micro-RNA (mRNA) and short hairpin molecules (shRNA). The invention also includes a composition comprising the siNA molecule in a carrier or diluent. The siNA molecules have neuroprotective activity and may be useful in gene therapy. The double stranded siNA molecules are useful in preparing a composition for treating NOGO receptor-associated disorders, e.g. neurological disorders. This sequence represents a sense strand/NOGO receptor target region of an
                                                                                                                                                                                                      New chemically synthesized double stranded siNA molecule that directs cleavage of a NOGO receptor RNA via RNA interference, useful in preparing a composition for treating e.g., neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NOGO receptor; RNA interference; gene silencing; neuroprotective; gene therapy; neurological disease; short interfering RNA; siRNA; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ठ
                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a novel chemically synthesized double stranded short interfering nucleic acid (siNA) molecule which directs cleavage of a NOGO receptor RNA via RNA interference (RNAi). Each strand of the siNA molecule is 18-23 nucleotides in length. One strand of the siNA molecule NOGO receptor RNA. The siNA molecules include short interfering RNA (siRNA), double-stranded RNA (dsRNA), micro-RNA (miRNA) and short hairpin molecules (siRNA). The invention also includes a composition comprising the siNA molecule in a carrier or diluent. The siNA molecules have neuroprotective activity and may be useful in gene therapy. The double stranded siNA molecules are useful in preparing a composition for treating NOGO receptor-associated disorders, e.g. neurological disorders. This sequence represents a NOGO receptor siRNA molecule antisense strand

The invention describes a chemically synthesized double-stranded short interfering nucleic acid (siNA) molecule (I) directing cleavage of NOGO creceptor RNA through RNA interference (RNAi), where each strand of the molecule is 18-23 nucleotides in length, and one strand of the molecule comprises nucleotide sequence having sufficient complementarity to the NOGO receptor RNA for the siNA molecule to direct cleavage of the NOGO receptor RNA through RNAi. Also described is a composition comprising (I) together with a carrier or diluent. (I) is useful for downregulation or inhibition of expression of NOGO and/or NOGO receptor haplotype polymorphism that are associated with a disease or condition (e.g., neurologic diseases, disorders and/or conditions). (I) is useful for treating or preventing central nervous system (CNS) injury, cerebrovascular accident (CVA), stroke, Alzheimer's disease, dementia or multiple sclerosis. (I) is useful as reagents in ex vivo applications e.g., in tissue or cells that are transplanted into a subject for therapeutic effect. This sequence represents a NOGO receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel chemically synthesized double-stranded short interfering nucleic acid molecule directing cleavage of NOGO (Neurite outgrowth inhibitor) receptor RNA through RNA interference, useful in treating Alzheimer's
antisense therapy; gene expression; neurological disease; nervous system injury; cerebrovascular ischemia; Alzheimers disease; dementia; multiple sclerosis; NGO receptor; siRNA; short interfering RNA; RNA interference; gene silencing; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    .

```
The invention relates to a method of identifying a compound that induces chondrocyte anabolic stimulation. The methods and agent are useful for treating and/or preventing a disease involving a systemic or local carease in cartilage, e.g. osteoarthritis, rheumatoid arthritis, septimic or infectious arthritis, reactive arthritis, gouty arthritis, septimic or infectious arthritis, reactive arthritis, reflex sympathetic septic or infectious arthritis, reactive arthritis, reflex sympathetic intropathy, algodystrophy, Tietze syndrome or costal chondritis, intropathy, osteoarthritis deformans endemica, Meeleni disease, Handigodu disease, degeneration resulting from fibromyalgia, systemic lupus erythematosus, scleroderma, ankylosing spondylitis, hereditary chondrolysis, chondrodysplasia, pseudoachondrodysplasias, microtia, and metaphyseal chondrodysplasia. The agent is useful in the manufacture of a medicament for the treating and/or preventing a disease involving a decrease in mean cartilage thickness, e.g. osteoarthritis, chypercalcemia of malignancy, multiple myelomatosis, hyperparathyroidism, and hyperthyroidism. The present sequence represents a human chondrocyte anabolic stimulation associated target DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Identifying a compound that induces chondrocyte anabolic stimulation, useful for treating osteoarthritis, comprises measuring a compound-polypeptide property related to the anabolic stimulation of chondrocytes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a chemically synthesized double-stranded short interfering nucleic acid (siNA) molecule (I) directing cleavage of NOGO receptor RNA intrough RNA interference (RNAi), where each strand of the molecule is 18-23 nucleotides in length, and one strand of the molecule comprises nucleotide sequence having sufficient complementarity to the NOGO receptor RNA for the siNA molecule to direct cleavage of the NOGO receptor RNA through RNAi. Also described is a composition comprising (I) together with a carrier or diluent. (I) is useful for downregulation or inhibition of expression of NOGO and/or NOGO receptor proteins arising (from NOGO and/or NOGO receptor proteins arising in a disease or conditions). (I) is useful for treating or preventing central nervous system (CNS) injury, cerebrovascular accident (CNA), stroke, Alzhaimer's gisease, dementia or multiple sclerosis. (I) is useful as reagents in exvivo applications e.g., in tissue or cells that are transplanted into a subject for therapeutic effect. This sequence represents a NOGO receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel chemically synthesized double-stranded short interfering nucleic acid molecule directing cleavage of NOGO (Neurite outgrowth inhibitor) receptor RNA through RNA interference, useful in treating Alzheimer's

                                                                                                                                                                                                                                     This oligo(T) synthetic oligonucleotide was used for first strand cDNA synthesis from total RNA isolated from either logarithmically growing or quiescent 10T1/2 mouse fibroblast cells. It was also used with an arbitarary d(N10) primer in PCR. The PCR products were used in a differential display to identify the mSARP1 gene (see AAV19112) that codes for novel murine secreted apposis-related protein mSARP1 (see AAW3914). The invention relates to SARP polynucleotides (see also AAW19113-15) and polypeptides (see also AAW19113-15), antibodies specific and therapeutic methods, and methods for treating diseases related to the regulation of SARP expression in tissue and body fluid samples, including

                                                                                                                                                                                                          which comprises amplifying cDNA with first and second differently labeled primers and analysis of the amplified labeled cDNA. The method is useful for analyzing differential gene expression, for identifying and/or characterizing pharmacological activities or for identifying target genes. The use of different primer combinations allow more cDNAs to be amplified. The method also provides a more detailed analysis than prior art methods. This sequence represents a primer used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          optionally cleave, target sequences,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes nucleic acids (A) that interact stably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1951.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; hairpin ribozyme; antisense oligonuclectide; gene expression modification; cancer; bosphorothioate; endonuclease; anticancer; breast cancer; endometrium cancer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
Analysis of RNA samples, useful for detection of differential gene expression uses two differently labeled primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bellon L;
                                                                                                                                                                            invention describes a novel method for analysis of an RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

(A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to
                         can also be used to
for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (A) can also be used to correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research reagents (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves resistance to nucleases, binding affinity and/or activity. AAA23503 to AAA24747 represent coetrogen receptor hammerhead riboxyme sequences. AAA2593 to AAA2593 to AAA2593 to estream their corresponding target sequences.
                                                                                                                                                                                             sequences, and AAA26107 to AAA26218 represent their corresponding target sequences. AAA26219 to AAA26271 represent other ribozyme sequences and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            nucleic acids that interact, and optionally cleave, target sequences,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        present invention describes nucleic acids (A) that interact stably

This is one of a set of oligonucleotides (see ABA91527-30) used to assess the minimum number of ribonucleotides in DNA-RNA chimeric oligonucleotides required for RNase H cleavage. Each oligonucleotide of the set had a different number of ribonucleotides, 1 in the present case. The oligonucleotides were mixed with target DNA oligonucleotide AGT02009 (see ABA91531) and incubated with RNASE H (5 U/ml) at 37 degrees C for 30 minutes. The results showed that 4 ribonucleotides were the minimum
correlate inhibition of gene expression with alterations in phenotype, particularly for identification of therapeutic targets, and as research usegenes (for RNA, in the same way that restriction endonucleases are used with DNA). The combination of modifications in (A) improves AAA2447 represent oserrogen receptor hammerhead ribozyme sequences, and AAA2447 represent oserrogen receptor hammerhead ribozyme sequences, and AAA2593 represent their corresponding target sequences. AAA2593 to AAA26105 represent their corresponding target sequences, and AAA26107 to AAA2611 represent their corresponding target sequences. Sequences. AAA26219 to AAAA2671 represent their corresponding target sequences and antisense oligonucleotides used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Probes for detecting target nucleotide sequence in sample, has sequence that forms hairpin structure having a double-stranded segment and singlestranded loop collectively forming region complementary to target

number for RNA cleavage. The invention provides probes for nucleic acid hybridisation. The probes form a hairpin structure comprising a double-stranded stem and a single-stranded loop, and are capable of both intramolecular and intermolecular hybridisation. The double-stranded stem may comprise a methylphosphonate DNA:RNA hybrid that is resistant to strand in the DNA:RNA duplex becomes sensitive to RNAse H treatment and strand in the DNA:RNA duplex becomes sensitive to RNAse H treatment and can be removed. Arrays and methods for nucleic acid hybridisation using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of sequential consensus region-directed amplification for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples. The methods, kits and oligonucleotides are useful for sorting a mixture of DNAs into 2 or more subsets or distinguishing gene expression patterns in 2 samples e.g. for disease diagnosis and gene analysis. The present sequence is oligo APPCR primer used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               of

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15p2.0.2. and MD212 is encoded at chromosome 16p11.2 and MD212 is encoded at chromosome 15p2.0.2. and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23. MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                              Cytostatic, immunostimulant, gene therapy, vaccine, human, zinc finger protein; MDZ3; MDZ4, MDZ12; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is conceded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 16p1) 2 and MD212 is encoded at chromosome 16p1) 2 and MD212 is encoded at chromosome 16p1) 2 and MD212 is encoded at chromosome 16p2. MD27, and MD212 is encoded at chromosome 16p2 in an anufacturing a medicament for treating or preventing a disorder as associated with decreased or increased expression or activity of MD23. MD24, MD27, or MD212, e.g. cancer or developmental disorders. The nucleic acids and proteins are also useful for diagnosing or monitoring a disease caused by altered expression of MD23, MD24, MD27, or MD212. The nucleic acids can also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MDZ3, MDZ4, MDZ7, MDZ12. MDZ3 is concoded at chromosome 6p21.3-22.2, MDZ7 is encoded at chromosome 16p1.2 and MDZ12 is encoded at chromosome 16p2.2 and MDZ12 is encoded at chromosome 16p2.2 and MDZ12 is encoded at chromosome 16p2.2 and MDZ12 is encoded. The nucleic associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic caused by altered expression of MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids and also be used as probes to detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12. The nucleic acids can also be used as probes for detect and characterize gross alterations in MDZ3, MDZ4, MDZ7, or MDZ12 genetic locus. The probes are useful in constructing microarrays for measuring gene expression. The proteins are useful as therapoutic agents for gene therapy or as proteins are useful as therapoutic agents for gene therapy or as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Cytostatic; immunostimulant; gene therapy; vaccine; human; zinc finger protein; MD23; MD24; MD27; MD212; chromosome 7q22.1; chromosome 6p21.3-22.2; chromosome 16p11.2; chromosome 15q26.1; cancer; developmental disorder; ss.

The present invention relates to novel human zinc finger-containing proteins and their coding sequences: MD23, MD24, MD27, MD212. MD23 is encoded at chromosome 7q22.1, MD24 is encoded at chromosome 6p21.3-22.2, MD27 is encoded at chromosome 6p21.3-22.2, MD24, MD24, MD24, MD27, and MD212 sequences are useful in therapy, or in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MD23, MD24, MD27, or MD212, e.g. cancer or developmental disorders: The nucleic caused by altered expression of MD23, MD24, MD27, or MD212, e.g. cancer of detect and characterize gross active and also be used as probes to detect and characterize gross alterations in MD23, MD24, MD27, or MD212 genetic locus. The probes are useful in constructing microaarrays for measuring gene expression. The proteins are useful as therapeutic agents for gene therapy or as proteins are useful as therapeutic agents for gene therapy or as vaccines. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                 New zinc finger-containing proteins and nucleic acids, useful in manufacturing a medicament for treating or preventing a disorder associated with decreased or increased expression or activity of MDZ3, MDZ4, MDZ7 or MDZ12, e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing ALSO useful for treating breat, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and ALDS. The sequences shown in ABZ59889 - ABZ65216, ABZ65511, ABZ6550 - ABZ66524, ABZ66530 - ABZ6658 represent substrate/target sequences for the human ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antisense oligonucleotide; neurite growth inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; protein kinase PKR; cerebrovascular accident; central nervous system injury; CS injury; epinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autoimmune disease; lupue; multiple sclerosis; transplant rejection;
                                                                Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;

The invention comprises nucleic acids (e.g. antisense oligonucleotides)
that down regulate the expression or inhibit the function of a receptor
for a neurite growth inhibitor, NoGO, prostaglandin D2 receptor (PTGDR),
invention are useful for treating: cerebrovascular accident, central
nervous system (CNS) injury, spinal cord injury, cancer (e.g. melanoma,
confined or glioma), inflammatory disease (e.g. rheumatoid arthritis,
restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune
disease, lupus, multiple sclerosis, transplant/graft rejection,
ischaemia/reperfusion injury, glomerulomephritis, sepsis, and allergic
conditions (e.g. asthma, allergic thinitis or atopic dermatitis). The
nucleic acids of the invention are also useful for down-regulating the
expression of a target gene and as a diagnostic tool to examine genetic
drifte and mutations within diseased cells or to detect the presence of
target RNA in a cell. The present RNA sequence represents a human PKR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antisense oligonucleotide; neurite growth.inhibitor; NOGO; prostaglandin D2 receptor; PTGDR; IkappaB kinase; IKK; prostal kinase PKR; cerebrovascular accident; central kinase PKR; cerebrovascular accident; central nervous system injury; CNS injury; spinal cord injury; cancer; melanoma; lymphoma; glioma; inflammatory disease; rheumatoid arthritis; restenosis; asthma; Crohn's disease; diabetes; obesity; autoride accidential autoimmune disease; lupus; multiple solerosis; transplant rejection; graft rejection; ischaemia; reperfusion; glomerulonephritis; sepsis; allergy; asthma; allergic rhinitis; atopic dermatitis; human PKR;
Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.

ö

that down regulate the expression or inhibit the function of a receptor for a neurite growth inhibitor, NOGO, prostaglandin D2 receptor (PrGDR), ISAPPAB kinase (IKK), or protein kinase PKR. The nucleic acids of the invention are useful for treating: cerebrowascular accident, central nervous system (CMS) injury, spinal cord injury, cancer (e.g. melanoma, CT lymphoma or glioma), inflammatory disease (e.g. relamaciól arthritis, restenosis or asthma), Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, conditions (e.g. asthma, allergic rhinitis or atopic dermatitis). The nucleic acids of the invention are also useful for down-regulating the cypression of a target gene and as a diagnostic tool to examine genetic diffs and mutations within diseased calls or to detect the presence of a target con an acell. The present RNA sequence represents a human PKR ö CpG immunostimulatory oligonuclectide; immune response; allergy; asthma; viral infection; bacterial infection; cancer; lymphoma; intraepithelial neoplasm; melanoma; neuroblastoma; Hodgkin's lymphoma; carcinoma; sarcoma; gene therapy; phosphorothioate; ss. Novel enzymatic nucleic acid that down-regulates expression of neurite growth inhibitor receptor, prostaglandin D2 receptor, IkappaB kinase or protein kinase PKR genes, for treating cancer and inflammatory disease.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò
                                                                                                                                           The invention relates to a class of CpG immunostimulatory
oligomucleotides containing a 5'TCG motif or a CG at or the 5' end that
are useful for stimulating an immune response. Oligomucleotides and
compositions of the invention are useful for treating allergy or asthma,
viral and bacterial infections and cancer e.g. biliary tract cancer,
breast cancer, cervical cancer, choriocarcinoma, colon cancer,
endometrial cancer, gastric cancer, lymphomas, intraepithelial neoplasms,
cerdometrial cancer, gastric cancer, pancreatic cancer, prostate cancer,
certal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer,
cetal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer,
and CNS cancer, connective tissue cancer, osesophageal cancer, eye cancer,
cetal cancer, as well as other cavity cancer, skin cancer,
testicular cancer, as well as other carcinomas and sarcomas. The
invention is also useful in gene therapy. The present sequence is a CpG
immunostimulatory oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CpG immunostimulatory oligonucleotide; immune response; allergy; asthma; vtal infection; bacterial infection; cancer; lymphoma; intraepithelial neoplasm; melanoma; neuroblastoma; Hodgkin's lymphoma; carcinoma; sarcoma; gene therapy; phosphorothioate; ss.
New oligonucleotides, useful for treating allergy or asthma, viral and bacterial infections, and cancer, e.g. biliary tract cancer, breast

The invention relates to a class of CpG immunostimulatory oligonucleotides containing a 5'TCG motif or a CG at or the 5' end that are useful for stimulating an immune response. Oligonucleotides and compositions of the invention are useful for treating allersy or asthma, viral and bacterial infections and cancer e.g. biliary tract cancer, breast cancer, gastric ancer, thoriocarcinoma, colon cancer, endometrial cancer, gastric ancer, lymphomas, intraspithelial neoplasms, liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma, neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer, rectal cancer, sarcomas, thyroid cancer, renal cancer, bone cancer, brain and CNS cancer, connective tissue cancer, rosophageal cancer, brain and CNS cancer, as well as other carcinomas and sarcomas. The invention is also useful in gene therapy. The present sequence is a CpG incorrection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a class of CpG immunostimulatory
oligonucleotides containing a S'TCG motif or a CG at or the S' end that
are useful for stimulating an immune response. Oligonucleotides and
compositions of the invention are useful for treating allergy or asthma,
viral and bacterial infections and cancer e.g. biliary tract cancer,
breast cancer, cervical cancer, choriocarcinoma, colon cancer,
endometrial cancer, gastric cancer, lymphomas, intraepithelial neoplasms,
liver cancer, lung cancer (e.g. small cell and non-small cell), melanoma,
neuroblastomas, ovarian cancer, pancreatic cancer, prostate cancer,
rectal cancer, sarcomas, thyroid cancer, renal cancer, brain
and CNS cancer, connective tissue cancer, respandable cancer, brain
and CNS cancer, as recomes, thyroid cancer, respandable cancer, brain
testicular cancer, as well as other carcinomas and sarcomas. The
invention is also useful in gene therapy, The present sequence is a CpG
                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CpG immunostimulatory oligonucleotide; immune response; allergy; asthma; viral infection; bacterial infection; cancer; lymphoma; intraeptthelial neoplasm; melanoma; neuroblastoma; Hodgkin's lymphoma; carcinoma; sarcoma; gene therapy; phosphorothioate; DNA-RNA hybrid; ss.
    New oligonucleotides, useful for treating allergy or asthma, viral and bacterial infections, and cancer, e.g. biliary tract cancer, breast cancer, cervical cancer.

The invention relates to a double-stranded short interfering RNA (siRNA)

molecule (1) comprising a first nucleotide sequence having 19-23

nucleotides complementary to an RNA sequence encoding HRR2 or its

portion, and a second nucleotide sequence, having 19-23 nucleotides

contion, and a second nucleotide sequence, and including at least

one nucleotide that is not a 2'-OH containing ribonucleotide. Also

described is a method of producing a class of nucleic acid-based gene

modulating agents that exhibit a high degree of specificity for RNA of a

desirbed target. (I) is useful for modulating HRR2 activity in a cell, and

containing agents that exhibit a high degree of specificity for RNA of

desirbed target. (I) is useful for modulating the RR2 activity in a cell, and

containing acancer, breast cancer, such as pancreatic cancer,

bladder cancer, lung cancer, breast cancer or prostrate cancer. The

present sequence represents a human H-Ras substrate RNA sequence for a

NNAzyme (ribozyme), which is used in an example from the present

invention for the identification of potential target sites in human Ras
                                                                                                                                                                                                                                                                                                                                                                                  Novel double-stranded short interfering RNA molecule having first nucleotide sequence complementary to RNA encoding HER2 or its portion, and second nucleotide sequence having complementarity to first sequence,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 1; SEQ ID NO 1337; 143pp; English.

New oligonucleotides, useful for treating an allergy or asthma, or an autoimmune disease, arthritis, systemic lupus erythematosus, multiple sclerosis, Crohn's disease, or Type 1 diabetes mellitus.

Example; SEQ ID NO 59; 111pp; English

The invention relates to an oligonucleotide having the formula: (a) 5' XIXIXZX2 3' where 5' denotes the 5' and of the oligonucleotide and where 5' and cotted the oligonucleotide, where X is a T or modified The concloside, and where a 3' of an olification the concloside and Where a 3' of an olification and Na and Na are polymucleotide that do not include a CG dinucleotide, and Where a 3' of the oligonucleotide and the NZ dinucleotide and where a 3' olification and Na and NZ are polymucleotide and the NZ dinucleotide and where a 3' olification and NZ are polymucleotide and where a 3' olification and NZ are polymucleotide and where a 3' olification of the oligonucleotide in the oligonucleotide and where NZ is a core modified The nucleotide. NI is a composition to nucleotide, and where NZ is a composition to composition the size of the month of the oligonucleotide of 5 to 30 nucleotides, where NI does not include 5' a nucleotide are (1) a pharmaceutical composition for onerginal matibodies, and where NZ is polymucleotide of 5 to 30 nucleotides, and where NZ is polymucleotide of 5 to 30 nucleotides, and office and manaceutical composition comprising the oligonucleotide in combination with a therapeutic agent eslected from chancherapeutic agents encolonal matipoderic and where NZ is pharmaceutical composition to comprising an anticonal matipode or application of supplied to a palative to interferon (ITM) alpha expression in a subject. comprising administering an immunostiminatory nucleic and composition to a subject where the subject in the subject in a subject by administering an immunostiminatory nucleic acid or composition to the subject where the mannostiminatory nucleic acid or composition to the subject where the immunostiminatory nucleic acid or composition to the subject where the immunostiminatory nucleic acid or composition to the subject where the immunostiminatory nucleic acid or composition to the subject where the immunostiminatory nucleic acid or composition is administerial an immunostiminatory nuclei temporal arteritis, anti-phospholipid syndrome, psoriasis, pemphigus vulgaris, vasculitis such as Wegener's granulomacosis, vitiligo, Crohn's Disease, ulcerative colitis, primary biliary cirrhosis, autoimmune hepatitis, immune-mediated disetes mellitus, Grave's Disease, Hashimoto's thyroiditis, autoimmune oophoritis and orchitis, autoimmune disease of the adrenal gland, rheumatoid arthritis, scleroderma,

The invention relates to an oligonuclectide having the formula: (a) 5'
XYN1YZN2 3' where 5' denotes the 5' end of the oligonuclectide and 3'
denotes the 3' end of the oligonuclectide, where X is a T or modified T
cuclectide, Y is a C or modified C nuclectide, Z is a G or modified G
nuclectide, and N1 and N2 are polynuclectides that do not include a CG
dinuclectide, where N1 does not include 5' Z nuclectide, and where 3'
colynuclectide consisting of the YZ dinuclectide and the N2
polynuclectide consisting of the YZ dinuclectide and the N2
c polynuclectide contains a number of nuclectides that is at most 45% of
the number of nuclectides in the oligonuclectide and (b) 5' XYN1YZN2 3'
where 5' denotes the 5' end of the oligonuclectide and 3' denotes the 3'
c end of the oligonuclectide, where X is a T or modified T nuclectide, Y is
a C or modified C nuclectide, where X is a G or modified muclectide, N1 is a
polynuclectide of 5-10 nuclectides, where N1 does not include a CG
dinuclectide, where N1 does not include 5' Z nuclectide, and where N2 is
a polynuclectide of 5 to 30 nuclectides. Also described are: (1) a
pharmaceutical composition comprising the oligonuclectide in combination
if a therappeutic agent selected from chemcherapeutic agents.
                                                                                                                                                                                                                          ö
polymyositis, dermatomyositis, spondyloarthropathies such as ankylosing spondylitis, and Sjogren's syndrome. The autolimune disease is caused by an infection e.g. Lyme disease. This sequence represents an oligonucleotide used in experiments in the examples of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      with a therapeutic agent selected from chemotherapeutic agents, radiotherapeutic agents, monoclonal antibodies, and anticancer agents; (2) a method of specifically increasing interleukin (IL)-10 expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            autoimmune disease, arthritis, systemic lupus erythematosus, multiple
sclerosis, Crohn's disease, or Type 1 diabetes mellitus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New oligonucleotides, useful for treating an allergy or asthma, or an

call response to interferon (IFN)-alpha expression in a subject, comprising administering an oligonucleotide or a pharmaceutical composition to the subject in need of increased IL-10 expression relative to IFN-alpha expression; (3) a method of inducing an antigen specific regulatory T call response in a subject by administering an immunostimulatory nucleic acid or composition to a subject exposed to an antigen; (4) a method of inducing an antigen. Specific regulatory B cell response in a subject by administering an antigen. Specific regulatory nucleic acid or composition to a subject by administering an antigen. Specific acid or composition to the subject by astronaulatory nucleic acid or composition is administered in an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an amount subject by exposing a subject to a self antigen, and administering an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an amount subject to a self antigen, and administered in an amount subject to a subject to an implant and administered in an amount sufficient to prevent or treat an autoimmune disease in the subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or reduce an antigen administering an immunostimulatory nucleic acid or composition are useful for treating an action are useful for treating and composition are useful for treating allergies, asthma, autoimmune the invention are useful for treating allergies asthma, autoimmune the subject and a subject such as a current and as durable such as Guillain Barre, autoimmune their autoimmune their antigen are and a subject enemal, permic temporal arteritis, anti-phospholipid syndrome, psoriasis, pemphigus vulgaris, vasculitis such as Wegener's granulomatosis, vitiligo, Crohn's Disease, ulcerative colitis, primary biliary cirrhosis, autofimune hepatitis, immune-mediated diabetes mellitus, Grave's Disease. Hashimoto's thyroiditis, autoimmune oophoritis and orchitis, autoimmune disease of the adrenal gland, rheumatoid arthritis, scleroderma, polymyositis, dermatomyositis, spondyloarthropathies such as ankylosing spondylitis, and Sjogren's syndrome. The autoimmune disease is caused by an infection e.g. Lyme disease. New oligonucleotides, useful for treating an allergy or asthma, or an autoimmune disease, arthritis, systemic lupus erythematosus, multiple sclerosis, Crohn's disease, or Type 1 diabetes mellitus.

Example; SEQ ID NO 28; 111pp; English.

The invention relates to an oligonuclectide having the formula: (a) 5, XYNIYZNZ 3' where 5' denotes the 5' end of the oligonuclectide and 3' denotes the 3' end of the oligonuclectide, X is a T or modified G conclectide, Y is a C or modified G conclectide, and NI and NZ are polynuclectides that do not include a CC dinuclectide, where NI does not include 5' Z nucleotide, and where a 3' polynuclectide contains a number of mucleotide and the NZ polynuclectide contains a number of mucleotide and 3' denotes the 3' end of the oligonuclectide and 3' denotes the 3' cof the number of nucleotides in the oligonuclectide and 3' denotes the 3' cm of the oligonuclectide and 3' denotes the 3' cm of the oligonuclectide and 3' denotes the 3' cm of the oligonuclectide, where NI does not include a CC cm of the oligonuclectide, where NI does not include a CC cm oliveride of 5-10 nuclectides, where NI does not include a CC cm oliveride of 5-10 nuclectides. Also described are: (1) a polynuclectide of 5 to 30 nuclectides. Also described are: (1) a polynuclectide of 5 to 30 nuclectides. Also described are: (1) a polynuclectide of 5 to 30 nuclectides. Also described are: (1) a polynuclectide of 5 to 30 nuclectides. Also described are: (1) a polynuclectide of 5 to 30 nuclectides. Also described are: (1) a polynuclectide of 5 to 30 nuclectides. Also described are: (1) a polynuclectide of 5 to 30 nuclectides. Also described are: (1) a captorherapeutic agents, monoclonal anticodies, and anticancer agents, radiotherapeutic agents, monoclonal anticodies, and anticancer agents, crelative to interferon (IFN) alpha expression in a subject, compression crelative to interferon (IFN) alpha expression in a subject or composition to the subject or an antigen. Specific regulatory B cell response in a subject by administering an antigen-specific acid or composition to a subject exposed to an antigen, specific regulatory B cell response in an antigen and administering an antigen acid or composition is administering an antigen acid or composition is admi Crohn's disease, Type I diabetes mellitus, myasthenia gravis, autoimmune crohn's disease, Type I diabetes mellitus, myasthenia gravis, autoimmune neuropathies such as Guillain-Barre, autoimmune uveitis, autoimmune hemolytic anemia, pernicious anemia, autoimmune thrombocytopenia, temporal arteritis, anti-phospholipid syndrome, psoriaais, pemphigus vulgaris, vasculitis such as Wegener's granulomatosis, vitiligo, Crohn's blesses, ulcerative collitis, primary biliary cirrhosis, autoimmune hepatitis, immune-mediated diabetes mellitus, Grave's Disease, Hashimoto's thyroiditis, autoimmune oophoritis and orchitis, autoimmune amount sufficient to prevent or treat an autoimmune disease in the subject, and (7) a method of reducing an antigen-specific response to an implant in a subject by exposing a subject to an implant and administering an immunostimulatory nucleic acid or composition to the in a subject by exposing a subject to a self antigen, and administering an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an phosphorothicate linkage. The oligonuclectide, methods and compositions of the invention are useful for treating allergies, asthma, autoimmune diseases, arthritis, systemic lupus erythematosus, multiple sclerosis, subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or reduce an antigenspecific response to the implant in the subject. The oligonucleotide includes at least 1 modified internucleotide linkage such as a

autoimmune disease, arthritis, systemic lupus erythematosus, multiple sclerosis, Crohn's disease, or Type 1 diabetes mellitus. New oligonucleotides, useful for treating an allergy or asthma,

Example; SEQ ID NO 1; 111pp; English.

The invention relates to an oligonucleotide having the formula: (a) 5'

XYNIYZM2 3' where 5' denotes the 5' end of the oligonucleotide and 3'
denotes the 3' end of the oligonucleotide, where X is a T or modified T
nucleotide, Y is a C or modified C nucleotide, Z is a G or modified G
incleotide, where NI does not include 5' Z nucleotide, and where a 3'
polynucleotide consisting of the YZ dinucleotide and the NZ
polynucleotide contains a number of nucleotides that is at most 45% of
the number of nucleotides in the oligonucleotide, and (b) 5' XYNIYZN2 3'
where 5' denotes the 5' end of the oligonucleotide, and (b) 7' XYNIYZN2 3'
where 5' denotes the 5' end of the oligonucleotide and 3' denotes the 5'
end of the oligonucleotide, where X is a T or modified T nucleotide, Y is a
C or modified C nucleotide, and end of the oligonucleotide, NI is a
polynucleotide of 5-10 nucleotides, where NI does not include a CG
dinucleotide, where NI does not include 5' Z nucleotide, and where NZ is
a polynucleotide of 5 to 3 nucleotides. Also described are: (1) a
polynucleotide of 5 to 3 nucleotides. Also described in combination
with a therapeutic agent selected from chemotherapeutic agents;
radiotherapeutic agents, monoclonal antibodies, and anticancer agents;

allergen in the subject; (6) a method of treating an autoimmune disease allergen in the subject; (6) a method of treating an autoimmune disease in a subject by exposing a subject to a self antigen, and administering an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or treat an autoimmune disease in the subject; and (7) a method of reducing an antigen-specific response to an implant in a subject by exposing a subject to an implant antigen, and administering an immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an amount sufficient to prevent or reduce an antigenspecific response to the implant in the subject. The oligonucleotide includes at least I modified internucleotide linkage such as a phosphorothicate linkage. The oligonucleotide, methods and compositions of the invention are useful for treating allergies, asthma, autoimmune diseases, arthritis, systemic lupus erythematosus, multiple solerosis, crohn's disease, Type I diabetes mellitus, myasthenia gravis, autoimmune neuropathies such as Guillain-Barre, autoimmune uveitis, autoimmune hemolytic anemia, pernicious anemia, autoimmune thrombocytopenia, relative to interferon (IRN) another superson in a subject, comprising administering an oligonucleotide or a pharmaceutical composition to the subject in need of increased IL-10 expression in a subject, comprising expression, (3) a method of inducing an antiqen-specific regulatory T cell response in a subject by administering an immunostimulatory T acid or composition to a subject exposed to an antigen; (4) a method of inducing an antigen; (4) a method of inducing an immunostimulatory nucleic acid or composition to a subject exposed to an antigen; (5) a method of treating an allergy or subject exposed to an antigen; (6) a method of treating an allergy or subject to an antigen; (7) a method of treating an allergy or immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition to the subject, where the immunostimulatory nucleic acid or composition is administered in an polymyositis, dermatomyositis, spondyloarthropathies such as ankylosing spondylitis, and Sjogren's syndrome. The autoimmune disease is caused by an infection e.g. Lyme disease. This sequence represents an Hashimoto's thyroiditis, autoimmune oophoritis and orchitis, autoimmune disease of the adrenal gland, rheumatoid arthritis, scleroderma, method of specifically increasing interleukin (IL)-10 expression temporal arteritis, anti-phospholipid syndrome, psoriasis, pemphigus vulgaris, vasculitis such as Wegener's granulomatosis, villigo, Crol Disesse, ulcerative colitis, primary biliary cirrhosis, autoimmune hepatitis, immune-mediated diabetes mellitus, Grave's Disease, oligonucleotide used in experiments in the examples of the present

New oligonucleotides, useful for treating an allergy or asthma, or an autoimmune disease, arthritis, systemic lupus erythematosus, multiple sclerosis, Crohn's disease, or Type 1 diabetes mellitus.

temporal arteritis, anti-phospholipid syndrome, psoriasis, pemphigus vulgaris, vasculitis such as Wegener's granulomatosis, vitiligo, Crohn's Disease, ulcerative colitis, primary biliary cirrhosis, autoimmune hepatitis, immune-mediated diabetes mellitus, Grave's Disease, Crohn's disease, Type I diabetes mellitus, myasthenia gravis, autoimmune neuropathies such as Guillain-Barre, autoimmune uveitis, autoimmune hemolytic anemia, pernicious anemia, autoimmune thrombocytopenia, Example, SEQ ID NO 29, 111pp; English.

```
The invention describes a host cell transformed or transfected with a nucleic acid encoding a plant-derived carotenoid cleavage dioxygenase (CCD) enzyme. Also described are: (1) a plasmid or vector system comprising a nucleotide including one of 1617, 1696, 1653, or 1557-amino acid sequence (SEQ ID No. 1, 3, 5, or 9) given in the specification or a sequence that is 754 homologous; (2) producing (M1) a carotenoid cleavage compound comprising treating a carotenoid with a plant-derived CCD; (3) an enzyme comprising the amino acid sequence corresponding to Rubus an enzyme comprising the amino acid sequence corresponding to Rubus isolated nucleic acid molecule coding for the enzyme, comprising a nucleotide sequence that is the same as, or complementary to a 2429 base nucleotide sequence that is the same as, or complementary to a 2429 base pair sequence (SEQ ID NO.3) and (5) a CrtL-e enzyme comprising 527-amino acid sequence (SEQ ID No. 10) or its effective fragment. The host cell is used for producing a carotenoid cleavage compound, e.g. alpha or beta ionone, pseudo ionone, safranal, theaspirone, damascone or damascenome, and for producing GGDP, beta -carotene, lycopene, or delta carotene for use in flavoring or perfume applications including e.g. soft drinks, fruit juice or beverage
                                                                                                                                                                                                                                                                 ö

BAS is a member of polyketide synthase family. The host cell also comprises benzalacetone reductase (BAR) activity. The host cell is useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Poly T primer, to synthesize red raspberry CHS cDNA and rhubarb BAS cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Host cell comprising a benzalacetone synthase (BAS) polypeptide sequence or a 4-coumarate:CoA ligase (4CL) sequence, useful in a bacterial method of producing benzalacetone and/or raspberry ketone is new.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Flavor enhancer; food; cosmetics; weight loss; naringenin-chalcone synthase;
                                                                                                                                                                                                                                                         techniques. This sequence represents a primer associated with the isolation and cloning of DNA encoding a carotenoid cleavage dioxygenase
comprising whey protein, health teas, cocoa drinks, milk drinks and lactic acid bacterial drinks, yogurt, drinking yogurt and wine, bakery product including bread, Danish pastry, biscuits or cookies, confectionery product, pharmaceutical composition for therapeutic or diagnostic purposes. The invention provides reliable and efficient production of aroma compounds or precursors, particularly carotemoid cleavage compounds that does not rely solely on chemical synthesis techniques. This sequence represents a primer associated with the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Hall RD;

The present invention relates to a host cell comprising a chalcone synthase (GHS; also referred as naringenin-chalcone synthase, flavanone synthase; 6'-deoxychalcone synthase; flavanone synthase; 6'-deoxychalcone synthase; chalcone synthetase and DOCS; EC 2.3.1.74) polypeptide sequence and 4-coumarate.CoA ligase (4CL) also referred as 4-coumarcyl-CoA synthetase; p-coumaryl coenzyme A synthetase; p-coumaryl CoA synthetase; p-coumaryl-CoA synthetase; p-coumaryl-CoA synthetase; feruloyl Coenzyme A synthetase; p-coumaryl-CoA synthet
                                                                                                                                                                                                                                                                                                                                                    ö
production of benzalacetones and/or raspberry ketones from p-coumaric acid. Raspberry ketone is a flavor component used in the food industry. Benzalacetones and raspberry ketones are useful in aroma formulations in food market, cosmetics, household products such as air fresheners and in weight loss products. The present sequence is a PCR primar used in the synthesis of red raspberry chalcone synthase (CHS) cDNA and benzalacetone synthase (BAS) cDNA, which is used in the production of raspberry ketone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Host cell used in producing benzalacetone or raspberry ketone comprises chalcone synthase polypeptide sequence and 4-coumarate:COA ligase

Sequence beginning at mucleotide 2354. The sequence is a viral duplex sequence beginning at mucleotide 2354. The sequence is a viral duplex sequence contg. a purine-rich region concentrated on one chain of the duplex. The sequence may be prepd. by standard DNA synthesis. The HUMNFR of forming a triplex at physiological pH by coupling into the major groove of the DNA duplex. Three such oligomers which are capable of forming a triplex with this sequence. The oligomers are used in the treatment of inflammation. Similar oligomers may be used to target viral DNA duplexes specific for HIV, herpes and other viruses. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer is able to inhibit gene expression, as verified by in vitro systems. See also

The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2354 contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases, characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without and AAQ30226-447. (Updated on 25-MAR-2003 to correct PN field.)
Human tumour necrosis factor receptor mRNA; AIDS; modified; HIV; RSV;

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumour necrosis factor receptor mRNA beginning at nucleotide 2134 contg, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tumours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. See also AAQ25452-25501 and AAQ30226-448. (Updated on 25-MAR-2003 to correct PD field.)
                                 Human tumour necrosis factor receptor mRNA; AIDS; modified; HIV; RSV; HPV; malignancy; hepatitis; inflammation; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New oligomers contg. modified bases - which form a triplex with G-C doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis, herpes malignancy and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
        Oligomer TNFR942 for forming triplex with HUMNFR target duplex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0.6%; Score 15.4; DB 1; Length 18; 94.1%; Pred. This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis of a (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as a spoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                       Novel apoptosis-related DNAs and proteins - for diagnosis, preventing or treating diseases associated with apoptosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as a poptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel apoptosis-related DNAs and proteins - for diagnosis, preventing treating diseases associated with apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

jical staining, as apoptosis inhibitors. It can also be used of apoptosis-related diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperucicemia and sleep apnea syndrome. The genes (AA29631-633) and the proteins (AAX67588-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AA290640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                                                               A physiologically active protein specifically derived from mammal tissue.
                                                                                                                                                                                                                                         Adipose tissue, obesity, diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.

The genes (AA29631-633) and the proteins (AAX67589-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A physiologically active protein specifically derived from mammal tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A physiologically active protein specifically derived from mammal tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to identification of genes and proteins of adipose
Adipose tissue; obesity; diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Adipose tissue, obesity, diabetes; hyperlipemia; hypertension; human; arteriosclerosis; hyperuricemia; sleep apnea syndrome; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The genes (AAZ90631-633) and the proteins (AAX57589-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51
tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuticemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAX67598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A physiologically active protein specifically derived from mammal tissue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuticemia and sleep apnes syndrome. The genes (AA29631-633) and the proteins (AAV67598-V67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AA290640-51 represent PCR primers amplifying the human adipose tissue genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A physiologically active protein specifically derived from mammal tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        A physiologically active protein specifically derived from mammal tissue.

The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAZ6759B-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose tissue genes

Novel biallelic markers used to construct a high density disequilibrium map of the human genome

Claim 8; Page 1278; 2745pp; English.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ6579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side effects from pharmaceutical agents acting on a disease as well as other treatment.

New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic acid sample.

Claim 1; Page 53; 83pp; English.

primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a cliquance of the invention. The PCR primer are used to amplify a coligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or cliqual single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or cliqual shaving a pathological phenotypic trait suspected of being assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic traits suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. caused by one or more SNPs. Phenotypic traits include disease e.g. dystrophy, familial hypercholesterolemia, polycystic kidney disease, osteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arkhitis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide

RT-PCR was used to characterise metabolic enzyme induction by vitamin D analogues, corticosteroids and macrolactams in human skin. The invention provides for the use of antagonists of P450 enzymes for the prevention alleviation of a tachyphylactic response to administration of a vitemin D analogue, corticosteroid or macrolactam to a patient, e.g. for the treatment of psoriasis. The underlying cause of tachyphylaxis was shown to be degradation of a drug in the patient, rather than desensitization or receptor down-regulation. Exposure of a patient to the drug for extended periods regults in an increase in the expression of enzymes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         especially a P450 cycochrome, by administration of an antagonist of the enzyme. Detection of an increase in the amount and/or activity of a metabolic enzyme capable of metabolizing a drug following extended exposure of a cell from an individual to the drug indicates the increased likelihood of that individual developing a tachyphylactic response to the
microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        which are capable of metabolizing the drug. A method for treatment of tachyphylaxis therefore involves inhibiting the induced metabolic enzyme,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  a metabolic

The invention relates to an antisense oligonucleotide or its active derivative selected from AEC46374-AEC46395, targeting human interleukince derivative selected from AEC46374-AEC46395, targeting human interleukince derivative selected from AEC46374-AEC46395, targeting human interleukince oligonucleotide (or its active derivative, by adding consecutive coligonucleotide (or its active derivative, by adding consecutive concleotide (and interpretains), a pharmaceutical composition comprising concleotide chain), a pharmaceutical composition compraising composition for treating cancer. The oligonucleotide is an antisense composition for treating cancer. The oligonucleotide is an antisense coligonucleotide inhibiting the synthesis of proteins involved in the coligonucleotide inhibiting the production of transforming growth factor (TGF)-beta 1, TGF-beta 2, TGF-beta 3, cell-cell adhesion molecules coligonucleotide inhibiting the production of transforming growth factor (TGF)-beta 1, TGF-beta 2, TGF-beta 3, cell-cell adhesion molecules colimbitions (THPS) and/or interleukins 10. The oligonucleotides are useful for the preparation of a pharmaceutical composition for inhibiting cancer, breast cancer, bronchogenic Cancer, bronchogenic Cancer, bronchogenic Cancer, pastric cancer, color carcinoma, modullary carcinoma, non-small cell cancer, dastric cancer, head and neck cancer, hepatocellular cancer, cancer, head and neck cancer, hepatocellular carcinoma, color carcinoma, papillary adenocarcinoma, prostate cancer, small cell carcinoma, skin cancer, soft tissue cancer, squamous cell carcinoma, intestine carcinoma, skin cancer, soft tissue cancer

derivative selected from AEC46374-AEC46395, targeting human interleuking derivative selected from AEC46374-AEC46395, targeting human interleuking colliquoucleotide (or its active derivative, by adding consecutive nucleosides and linker stepwise or by cutting the oligonucleotide out of longer oligonucleotide chain), a pharmaceutical composition comprising the artisense oligonucleotide and a TGF-beta 2 antagonist for preparing a composition for treating cancer. The oligonucleotide is an antisense oligonucleotide inhibiting the synthesis of proteins involved in the composition of metastases. The oligonucleotide is an antisense oligonucleotide inhibiting the production of transforming growth factor (TGF)-beta 1, TGF-beta 3, Cell-cell adhesion molecules (CAMS), integrins, selectins, metalloproteases (MMPS), their tissue inhibitors (TIMPS) and/or interleukins 10. The oligonucleotides are useful for the preparation of a pharmaceutical composition for inhibiting the formation of metastases in cancer treatment. The oligonucleotides are
                                                                                                                                                                                                                                         ö
testicular carcinoma, uterine cancer, acoustic neuromas, neurofibromas, trachomas, and pyogenic granulomas; pre-malignant tumors, blastoma, Ewing's tumor, craniopharyngioma, ependymona, medulloblastoma, hemangioblastoma, medullablastoma, etanoma, mesothelioma, neuroblastoma, hemangioblastoma, etinoblastoma, estroma, pinaloma, neuroblastoma, wilm's tumor and/or myeloma, multiple. The present sequence is an antisense oligonucleotide targeting human TGF-beta-3.

The invention relates to a method of estimating the disease risk of an individual which comprises assessing in the genetic material a sequence polymorphism, obtaining a sequence polymorphism response, and estimating the disease risk of the individual based on the sequence polymorphism response. The methods are useful for estimating the disease risk of an individual comprises, estimating the disease prognosis of an individual and estimating a treatment response of an individual suffering from cancer to a disease treatment. The methods can be used for identifying subjects with increased risk of having or developing cancer. The present sequence represents a human chromosome 19q r region PCR primer. The invention relates to a method of estimating the disease risk of an individual which comprises assessing in the genetic material a sequence polymorphism, obtaining a sequence polymorphism response, and estimating the disease risk of the individual based on the sequence polymorphism response. The methods are useful for estimating the disease risk of an individual comprises, estimating the disease prognosis of an individual and estimating a treatment response of an individual suffering from cancer to a disease treatment. The methods can be used for identifying subjects with increased risk of having or developing cancer. The present sequence represents a human chromosome 19q r region primer/probe. Createsion (SNPE) primers, and the sequences of regions flanking

Sites of single nucleotide polymorphisms SNPs. The present invention

includes kits for determining the presence or absence of a SNP, using the

includes kits for determining the presence or absence of a SNP, using the

Creates are useful for genotyping a nucleic acid sample by

Derforming a single-nucleotide primer extension reaction. The

Cligonucleotides are useful for determining the presence, absence or

identity of a SNP and for genotype of an individual or group of

clidentity of a SNP and for genotype of an individual or group of

individuals, having a pathological phenotypic trait suspected of being

caused by one or more SNPs. Phenotypic trait suspected of being

caused by one or more SNPs. Phenotypic trait suspected of being

caused by one or more SNPs. Phenotypic traits include diseases e.g.

agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular

dystrophy, familial hypercholesterolaemia, polycystic kidney disease,

cateogenesis imperfecta and acute intermittent porphyria. Phenotypic

ctraits also include symptoms of or susceptibility to multifactorial

cdisease of which a component is or may be genetic such as autoimmune

diseases, including, rheumatoid arthritis, multiple sclerosis,

microorganism. The method is also useful in forensic investigations and

paternity analysis. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention comprises primers for analysing the expression of cytochrome P450 1 Al gene and cytochrome P450 Bl0 gene, and estimating the toxicity of a test agent. The PCR primers of the invention are useful for analysing tan expression of cytochrome P450 1 Al gene and P450 2Bl0 gene and estimating the toxicity of a test agent. The present DNA sequence represents a PCR primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New oligonucleotide useful for analyzing expression of cytochrome P450 1 Al gene and cytochrome P450 BlO gene, and estimating toxicity of test
                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

```
The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human Myc or Myb genes by RNA interference. The sinAs may or comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonuclectide and an misense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double specifically, the siNAs include short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonuclectides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express siNA. The siNAs are used to modulate expression of the Myc or Myb genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and used for treating cancers and other proliferative diseases, such as retenosis and polycystic kidney disease. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human Myc-targeted challed and and bene mapping the upper strand of a human Myc-targeted challed polymorphisms).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence represents the upper straing of a manner my constraint double-stranded siNA, which is identical to the Myc transcript target
Human; Myc; Myb; cancer; proliferative disease; restenosis; polycystic kidney disease; RNA interference; short interfering mucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short hairpin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics; gene function analysis; gene function analysis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of Myc or Myb genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 19 BP; 9 A; 1 C; 8 G; 0 T; 1 U; 0 Other;

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human Myc or Myb genes by RNA convergulate expression of the human Myc or myb genes by RNA convergulate expression of the human Myc or myb genes by RNA controlled for an antisense and antisense and antisense or single stranded. They further comprise sense and antisense coligonucleotide. Specifically, the siNAs include short interfering RNA (shRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (shRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised. Cc an contain deoxyribonucleotides, and can be chemically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA, conjugates and/or complexes of siNA, and vectors that express sinA. The siNAs are used to modulate expression of the Myc or Myb genes in cells, tissue cy transplants for the treatment of a variety of conditions. They may be consecuted in conditions. They may be consecuted in the conditions and consecution and consist and polycystic kidney disease. The siNAs are also useful for drug screening, genetic engineering, pharmacogenomics, studying gene condition, and gene mapping (e.g., of single nucleotide polymorphisms).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 19 BP; 1 A; 8 C; 1 G; 0 T; 9 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises DNA sequences which are associated with intestinal epithelium and peyer's patch M cells. The DNA sequences of the invention are useful for assessing, modifying, modulating or regulating intestinal epithelium or M cell development. The DNA sequences of the invention are also useful in the treatment of: inflammatory bowel disease, glutenenteropathy, infectious diseases, autoimmune diseases diseases, multiple sclerosis, allergy, asthma and diabetic mellitus), diseases or disorders of the immune system, hypersensitivity, anaphylaxis, and blood group incompatibility. The present DNA sequence represents, a PCR primer that was used to amplify an intestinal

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          셤
                                                                                                                                                                                                                                                   The invention relates to a chemically synthesised double stranded short interfering ribonucleic acid (siRNA) molecule directing cleavage of severe acute respiratory syndrome (SARS) virus RNA through RNA interference, comprising a strand having nucleotide sequence with sufficient complementarity to the SARS virus RNA to direct cleavage of the SARS virus RNA through RNA interference, where the siRNA does not require the presence of nucleotides having a 2-hydroxy group for mediating RNA interference, and each strand of is 19-23 nucleotides in length. The siRNA is useful for modulating the expression of genes of associated with the development or maintenance of SARS virus infection, acute respiratory failure, viral pneumonia and/or disease states associated with SARS virus infection, and for treating SARS virus infection, acute respiratory failure, viral pneumonia and/or disease (transcription of SARS virus infection by preventing the strates associated with SARS virus infection by preventing the ctranscription of SARS sense. The siRNA is useful in diagnosis, and treatment of diseases and conditions the respond to the modulation of SARS sense. The siRNA is useful in ciagnosis, and therapeutic, diagnostic, target validation, genomic discovery, genetic capable of mediating RNA interference against SARS inside and ceconstituted in vitro system, and has high degree of specificity with respect to SARS RNA expression. The present sequence is a lower strand of constituted in vitro system, and has high degree of specificity with respect to SARS RNA expression. The present sequence is a lower strand of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                              Novel chemically synthesized double stranded short interfering nucleic acid molecule directing cleavage of severe acute respiratory syndrome virus RNA through RNA interference, useful for treating viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SARS; severe acute respiratory syndrome; siRNA; short interfering RNA; ss; RNA interference; gene silencing; SARS virus infection; acute respiratory failure; viral pneumonia.

The invention relates to a chemically synthesised double stranded short interfering ribonucleic acid (siRNA) molecule directing cleavage of severe acute respiratory syndrome (SARS) virus RNA through RNA contressed comprising a strand having nucleotide sequence with sufficient complementarity to the SARS virus RNA to direct cleavage of the SARS virus RNA through RNA interference, where the siRNA does not require the presence of nucleotides having a 2'-hydroxy group for mediating RNA interference, and each strand of is 19-23 nucleotides in mediating RNA interference, and each strand of is 19-23 nucleotides in consociated with the development or maintenance of SARS virus infection, acute respiratory failure, viral pneumonia and/or disease states associated with SARS virus infection, and for treating SARS virus cute respiratory failure, viral pneumonia and/or disease states infection, acute respiratory failure, viral pneumonia and/or disease contents associated with SARS virus infection by preventing the transcription of SARS gene. The siRNA is useful in diagnosis, and transcription of SARS gene. The siRNA is useful in diagnosis, and transcription of SARS gene. The siRNA is useful in therefore, and pharmacogenomic applications. The siRNA is useful in therespeutic, diagnostic, target validation, genomic discovery, genetic capable of mediating RNA interference against SARS inside a cell or reconstituted in vitro system, and has high degree of specificity with respont to salve stranded siRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                              Novel chemically synthesized double stranded short interfering nucleic acid molecule directing cleavage of severe acute respiratory syndrome virus RNA through RNA interference, useful for treating viral infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; TSA7005; Reg; pancreatic beta cell growth; hypoglycaemic; diagnosis; PCR primer; 88.

                                                                                                                                                                                                                                                                                                                                                                     The present sequence represents a PCR primer which is used in an example from the present invention for the isolation of human TSA7005 gene. The human TSA7005 protein shares 32% homology with human and mouse Reg proteins, and 34% homology with the rat Reg protein. TSA7005 has pancreatic beta cell growth activity and hypoglycaemic activity. The TSA7005 protein can be used for the diagnosis and treatment of diseases associated with the gene and its expression product

The invention relates to a probe set for gene expression arrays to provide common equivalent signalling per probe and global amplification of the probe set has a pool of modified cDNA probes, each probe having a central target specific segment copied from a portion of a single mRNA transcript and a universal linker (a WRAP-Probe) located on or both terminal ends. The universal linker has reporter binding sites to join common reporters to the probes and primer binding sites to copy and amplify the probe. The probes and reporters are useful in componing discovery assays for a wide range of blomedical samples, including detection of nucleic acids and gene expression profiles in human diagnostics, forensics and genomic analysis. The methods are useful for amplifying and identifying any unknown DNA component and also for improving sensitivity with tissue microarrays or RNA arrays. The methods improve the quantification of gene expression and allow highly improved detection of rare transcripts or very small

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention comprises genes from Phanerochaete chrysosporium which exhibit a change in expression in the presence of an aromatic compound. The Phanerochaete chrysosporium genes of the invention are useful for analysing an environmental pollutant. The present DNA sequence represents an oligo dT PCR primer that was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel genes of eukaryotic microorganism belonging to Phenerochate genus, and exhibiting change in expression of behavior in presence of aromatic compound, is useful for analyzing environmental pollutant.
